DESIGN & DEVELOPMENT SCOPE

AfryStride Sportswear — Website

Phase 1: Mobile-First, Fully Responsive Business Website (Cart-Ready Foundation)

1. Purpose of This Document

This document defines exactly how the sportswear website will be laid out and designed across mobile, tablet, and desktop screens. It focuses purely on the user interface (UI), user experience (UX), and page-by-page layout — so that development can begin with a clear, agreed-upon visual direction. Business scope, timelines, and hosting are covered separately.

The overriding design goal: a clean, direct, uncluttered store that a customer can use without thinking. Every screen should answer three questions instantly — where am I, what can I buy, and how do I get it.

2. Design Principles

- Mobile-first: most Kenyan shoppers browse and buy from a phone. Every layout is designed for mobile first, then scaled up to tablet and desktop — not the other way round.
- Clarity over decoration: minimal visual noise. Strong product photography does the selling, not busy backgrounds or excess text.
- Maximum 2 taps to any product category from the homepage.
- Consistent, predictable navigation: the same header/menu logic on every page so customers never feel lost.
- Fast load first: compressed images, lazy-loading below the fold, no heavy animation that slows the store down on average Kenyan mobile data speeds.
- Trust signals visible early: contact/WhatsApp button, physical location, and clear pricing — sportswear buyers want to confirm sizing and authenticity fast.
- Design system built once, reused everywhere: buttons, cards, and spacing rules are defined centrally so Phase 2 (cart, checkout) drops into the same visual language without a redesign.

3. Visual Identity / Style Guide

The palette and signature motif below are pulled directly from the AfryStride Sportswear logo — black base, bold red, and the diagonal "speed line" detail behind the A — so the website reads as the same brand the customer already sees on the logo, not a generic storefront theme.

3.1 Colour Palette

Role	Colour	Usage
Primary (Black)	#0A0A0A	Header, footer, hero background, nav bar — matches logo background
Accent (AfryStride Red)	#E31E24	Buttons, price tags, sale badges, active states, speed-line motif
White	#FFFFFF	Primary text on dark sections, logo wordmark colour, card text

Neutral Light	#F5F5F5	Product card backgrounds on light sections (keeps long product grids easy on the eye against pure black)
Neutral Grey	#9CA3AF	Secondary text, captions, disabled states
Success/Stock	#1E8E3E	'In Stock' indicators

3.2 Typography

- Display face: a bold, slightly condensed sans-serif (e.g. Anton or Oswald) for headings and category titles — echoes the weight and italic energy of the "AfryStride" wordmark in the logo.
- Body face: a clean, highly legible sans-serif (e.g. Inter) for descriptions, prices, and UI labels — keeps the bold display type from tipping into hard-to-read at small sizes.
- Minimum body text size on mobile: 16px, to avoid pinch-zooming.
- Prices always bold and set in white or red-on-white for instant scanning.

3.3 Signature Motif & Components

The logo's diagonal speed-line detail (the three angled strokes trailing off the "A") becomes a reusable design device across the site — not just a logo mark. This is what makes the site instantly recognisable as AfryStride rather than an interchangeable e-commerce template.

- Speed-line motif reused as: section dividers, a subtle background graphic behind hero headlines, an underline/reveal effect on hover for menu items and buttons.
- Buttons: sharp or slightly angled corners (not fully rounded) to match the logo's aggressive, athletic geometry — solid red fill for primary actions ("Add to Cart" / "Order via WhatsApp"), red-outlined on black or white for secondary actions ("View Details").
- Product Card: image, product name, price, category tag, single primary action button — nothing more.
- Sticky bottom bar on mobile: black bar with red "WhatsApp / Order" button, always one tap away while scrolling.
- Badges: "New", "Best Seller", "School Uniform" tags in red-on-black or black-on-red, echoing the logo's contrast, to aid quick scanning.

4. Site Structure & Navigation

A flat structure keeps the store simple to browse. Primary navigation stays identical across devices, only the presentation changes (hamburger menu on mobile, full horizontal bar on desktop).

4.1 Primary Navigation

- Home
- Shop (dropdown / expandable on mobile) — Jerseys, Football Boots & Sports Shoes, School Sportswear, Tracksuits & Casual Wear, Accessories
- About
- Contact / WhatsApp

4.2 Category Logic

Because the shop carries several distinct product families (jerseys, shoes, school wear), each category gets its own filterable listing page rather than dumping everything into one grid. This is what future-proofs Phase 1 for the Phase 2 store — the same category structure becomes the shop's product taxonomy later.

5. Page-by-Page Layout

5.1 Homepage

Goal: instantly communicate what the shop sells and funnel visitors into a category within seconds.

Section	Mobile Layout	Desktop / Laptop Layout
Header	Logo left, hamburger menu right, sticky on scroll	Logo left, full horizontal nav centre/right, search icon
Hero Banner	Full-width image, single stacked headline + one CTA button	Full-width banner, headline + subtext + CTA side-by-side with image
Category Shortcuts	Horizontal scroll of category icons/cards	Grid of 4–5 category cards in one row
Featured Products	2-column product grid, vertical scroll	4-column product grid
Why Buy From Us	Stacked icon + text blocks (trust, quality, delivery)	3–4 columns side-by-side
Footer	Accordion-style collapsible links, socials, WhatsApp	Multi-column footer: links, contact, socials, map

5.2 Category / Shop Listing Page

Goal: let a customer scan, filter, and find a specific item fast — this is the highest-traffic page type in the store.

Section	Mobile Layout	Desktop / Laptop Layout
Filters	Collapsible "Filter" button opens bottom sheet (size, category, price)	Persistent left-hand sidebar with filters always visible
Product Grid	2 columns	3–4 columns
Sorting	Dropdown at top (Price, Newest, Popular)	Dropdown top-right of grid
Pagination	"Load more" button	Numbered pagination or infinite scroll

5.3 Product Detail Page

Goal: give enough confidence to buy without overwhelming — sizing and authenticity are the two biggest hesitations for sportswear buyers.

Section	Mobile Layout	Desktop / Laptop Layout
Images	Full-width swipeable image carousel	Left column image gallery with thumbnails, zoom on hover
Product Info	Stacked below image: name, price, size selector, stock status	Right column beside gallery: name, price, size selector, stock status
Action Buttons	Sticky "Order via WhatsApp" bar at bottom of screen	Prominent buttons directly under price, no stickiness needed

Description / Details	Expandable accordion (Size guide, Material, Care)	Tabbed section under the fold
Related Products	Horizontal scroll carousel	4-column grid

5.4 About Page

Short, visual, and human — builds trust. Story, photos of the shop/stock, and any team or sourcing detail. Same single-column flow on mobile and desktop, just wider margins and side-by-side image/text blocks on larger screens.

5.5 Contact Page

- Click-to-call and click-to-WhatsApp buttons at the very top, not buried at the bottom.
- Embedded Google Map.
- Physical address, opening hours, social links.
- Simple contact form as a secondary option (name, message, submit) — WhatsApp remains primary.

6. Responsive Breakpoint Strategy

The site will be built using a single fluid design system with three primary breakpoints, so layouts adjust smoothly rather than "snapping" awkwardly between devices:

Breakpoint	Screen Width	Layout Behaviour
Mobile	up to 767px	Single column, stacked sections, hamburger nav, sticky action bar, 2-col product grids
Tablet	768px – 1023px	2–3 column grids, expanded nav starts appearing, filters as slide-in panel
Desktop / Laptop	1024px and above	Full multi-column layouts, persistent sidebar filters, hover states, max content width capped (~1280–1440px) so text/images don't stretch awkwardly on large screens

All touch targets (buttons, links, size selectors) will be a minimum of 44×44px on mobile to prevent mis-taps — a common source of frustration on shoe/size selection UIs.

7. Frontend Implementation Notes

- Framework: React, using a utility-first CSS approach (Tailwind CSS) so the breakpoint system in Section 6 maps directly to code — keeps styling consistent and fast to build.
- Component-driven build: Header, Footer, ProductCard, CategoryFilter, and Button are built once as reusable components and reused across every page — this is what keeps the UI consistent and makes Phase 2 (cart, checkout) easy to slot in later.
- Images optimised and served in responsive sizes (srcset) so mobile devices don't download unnecessarily large desktop images.
- All product data pulled from the FastAPI/MongoDB backend already scoped, so the admin panel controls what appears in these layouts.

8. Usability Safeguards

To make sure the client and customers never find the site confusing or reject it:

- Every interactive element is visually obvious as clickable/tappable (no ambiguous icons without labels).
- No more than one primary call-to-action per screen section, so customers are never unsure what to do next.
- Consistent iconography and spacing throughout — no page should feel like it belongs to a different site.
- Before development, one homepage + one product page will be mocked up and reviewed with the client and, ideally, 1–2 real potential customers, before the rest of the pages are built out in this same pattern.
